

This programme provides Tweens the creative space to problem-solve through a do-it-yourself activity. Just follow the instructions and have fun!

A cipher is a special code. It does not require a codebook to figure out the secret message, but relies on mathematics to keep messages secret. The more complex the mathematics is, the harder the secret message is to crack.

# BINARY CODE

Computers use the binary system to process information. This system uses only two digits to represent information: 0 or 1.

The binary system is made up of bits. Eight bits make a byte. The grouping of bytes can represent numbers from 0 to 255. This collection of numbers forms the ASCII (pronounced as as-kee), which stands for American Standard Code for Information Exchange. ASCII is used as a character encoding standard, which combines one language character with another, for electronic communication.

Use the **ASCII BINARY CHARACTER TABLE** as a guide to decode our 2-part secret message.

#### **ASCII BINARY CHARACTER TABLE**

|   | <b></b>   | .,, |           | - |           |
